

Forklift Fork Positioner

Fork Positioner for Forklift - A fork positioner is actually a device made out of top quality materials meant to be able to endure the most demanding procedures and work environments. This particular piece of equipment can enable the one driving to be able to operate the blades hydraulically without leaving the seat. Side shifting units have the added ability to laterally position the arms or the entire load so as to facilitate more precise lifting and position in a faster and much more efficient manner.

The fork pocket is somewhat unique and can enable the one operating it to be able to securely sway the forks into position without any worry of damaging the positioning cylinders. This could allow the operator the option to be able to perform simultaneous or independent fork movement, depending on the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are necessary. Standard OEM carriages could be transformed into blade positioners on existing units.
